

MATCHING NETWORK DESIGNS WITH COMPUTER SOLUTIONS

Prepared by: Frank Davis

INTRODUCTION

One of the problems facing the circuit design engineer is the design of high-frequency matching networks. Careful design of a network that will accomplish the required matching, harmonic attenuation, bandwidth, etc., and yield components of practical size can result in many hours spent with pencil and slide rule.

The design of matching networks for high-frequency circuits involves an infinite number of possibilities, and a complete tabulation of possible network solutions would be virtually impossible. However, it is often necessary to design matching networks with a $50 + j 0$ ohm impedance at one port. This, combined with a restricted range of impedance values to be matched, imposed by network and device limitations, makes practical a tabulation of some of the more commonly used networks. These design solutions are given in this report.

The network solutions included in this report have the limitation that one terminating impedance must be $50 + j 0$ ohms. These networks are often used for matching in transistor RF power amplifier circuits that have a 50-ohm source or load. When the network does not have a 50-ohm termination at either port, the mathematical procedure given for each network in Appendix I can be used for the solution.

COMPONENT CONSIDERATIONS

Four networks are presented in this report with solutions in the form of computer tabulations. Each network has its own limitations. Although the network configuration is normally up to the discretion of the design engineer, it is sometimes necessary to use one configuration in preference to another in order to obtain component values that are more realistic from a practical standpoint.

Component selection in the UHF and VHF frequency ranges becomes a major problem, and the network configuration to obtain realistic component values is of vital importance to the design engineer. Design calculations for matching networks can become completely meaningless unless the components for the network are measured at the operating frequency.

For example, a 100 pF silver mica capacitor that meets all specifications at 1 MHz can have as much capacitance as 300 pF at 100 MHz. At some frequency, the capacitor's series lead inductance will finally tune out the capacitance, thus leaving the capacitor net inductive.

Values of inductance in the low nanohenry range are also difficult to obtain, since the inductance of a one-inch straight piece of #20 solid tinned wire is approximately 20 nH.

Component tolerances have no meaning at VHF frequencies and above unless they are specified at the operating frequency. It cannot be over-emphasized that components must be measured at the operating frequency.

NETWORK SOLUTIONS

The resistor and capacitor shown in the box labeled "device to be matched" represent the complex input or output impedance of a transistor. These complex impedances have been represented in series form in some cases and parallel form in others, depending on which form is most convenient for network calculation. The resultant impedance of the network, when terminated with $50 + j 0$ ohms, must be equal to the conjugate of the impedance in the box. The computer tabulations provide this solution.

Network A (see Figure 1) is applicable only when the "device to be matched" has a series real part of less than 50 ohms. As we can see from the computer tabulation, as the series real part approaches 50 ohms, the reactance of C_1 approaches infinity. However, in RF power amplifiers, we normally find that the series real part of both the input and the output is less than 50 ohms, making this matching network applicable to most RF power amplifier stages. Where the terminating impedance is other than 50 ohms, the mathematical procedure for the network solution is given in Appendix I.

Network B (see Figure 2) is the Pi network widely used in vacuum tube transmitters. As is apparent from the computer tabulation, this network is often impractical for use where R_1 is small. For values of R_1 less than 50 ohms, the inductance of L becomes impractically small while the capacitance of both C_1 and C_2 become very large. Where the Pi network configuration must be used to match low values of impedance, a double Pi network, in which the Q of the first section is very low, can be utilized to yield practical components.

Figure 1. Network A

Figure 2. Network B

Network C has been solved in two forms (see Figure 3). Both of these networks have the limitation that R_1 must be less than 50 ohms. However, it must be stressed that this network configuration quite often yields the most practical components where low values of R_1 must be matched.

Network D (see Figure 4) is a "Tee" network. This network is useful for matching impedance less than or greater than 50 ohms. It has been observed in laboratory tests that this network configuration also yields very high collector efficiencies when used for output matching in transistor RF power amplifier stages.

SUMMARY

Four computer-solved networks have been presented. The mathematical procedure for the solution of each network has been given in Appendix I.* Although the networks have found major use in matching solid-state RF power amplifier stages, they are also applicable to any circuit where the individual network's limitations are fulfilled.

*For the derivation of the equations used, refer to *Electronic Circuit Analysis*, Volume 1, "Passive Networks," Philip Cutler.

APPENDIX I

To convert a parallel resistance and reactance combination to series:

$$R_s = \frac{R_p}{1 + (R_p/X_p)^2}$$

$$X_s = R_s \frac{R_p}{X_p}$$

To convert a series resistance and reactance combination to parallel:

$$R_p = R_s [1 + (X_s/R_s)^2]$$

$$X_p = \frac{R_p}{X_s/R_s}$$

To solve network A:

1. Select a Q

$$X_{L1} = QR_1 + X_{Cout}$$

$$X_{C2} = AR_L$$

$$X_{C1} = \frac{(B/A)(B/Q)}{(B/A) - (B/Q)} = \frac{B}{Q - A}$$

$$\text{where } A = \sqrt{\left[\frac{R_1(1 + Q^2)}{R_L} \right] - 1}$$

$$B = R_1(1 + Q^2)$$

To solve network B:

1. Select a Q

$$X_{C1} = R_1/Q$$

$$X_{C2} = R_L \sqrt{\frac{R_1/R_L}{(Q^2 + 1) - (R_1/R_L)}}$$

$$X_L = \frac{QR_1 + (R_1 R_L / X_{C2})}{Q^2 + 1}$$

To solve network C1:

1. Select a Q

$$X_{L1} = X_{Cout}$$

$$X_{C1} = QR_1$$

$$X_{C2} = R_L \sqrt{\frac{R_1}{R_L - R_1}}$$

$$X_{L2} = X_{C1} + \left(\frac{R_1 R_L}{X_{C2}} \right)$$

To solve network C₂:

1. Select a Q
2. L₁ is not used in this network

$$X_{C1} = QR_1$$

$$X_{C2} = R_L \sqrt{\frac{R_1}{R_L - R_1}}$$

$$X_{L2} = X_{C1} + \left(\frac{R_1 R_L}{X_{C2}} \right) + X_{Cout}$$

To solve network D:

1. Select a Q

$$X_{L1} = (R_1 Q) + X_{Cout}$$

$$X_{L2} = R_L B$$

$$X_{C1} = \frac{(A/Q)(A/B)}{(A/Q) + (A/B)} = \frac{A}{Q + B}$$

$$\text{where } A = R_1 (1 + Q^2)$$

$$B = \sqrt{\left(\frac{A}{R_L} \right) - 1}$$

NETWORK A

TO DESIGN A NETWORK USING THE TABLES

1. Transform the parallel impedance of the device to be matched to series form ($R_1 + jX_{Cout}$).
2. Define Q, in column one, as X_{L1}/R_1 .
3. Choose a Q.
4. For a Q, find the R_S to be matched in the R column and read the reactive value of the components.
5. X_{L1}' is equal to the quantity X_{L1} obtained from the tables plus $|X_{Cout}|$.
6. This completes the network.

NETWORK B

The following is a computer solution for the Pi network when R_L equals 50 ohms.

TO DESIGN A NETWORK USING THE TABLES

1. Define Q, in column one, as R_1/X_{C1} .
2. C_1 actual is equal to C_1 – parallel C_{out} of device to be matched.
3. This completes the network.

| Q | X_{C1} | X_{C2} | X_L | R_1 |

NETWORK C₁

The following is a computer solution for an RF matching network.
This computer solution is applicable for two forms of matching networks.

TO DESIGN A NETWORK USING THE TABLES

1. $X_{L1} = X_{Cout}$.
2. Define Q, in column one, as X_{C1}/R_1 .
3. All network values can now be read from the charts in terms of reactance.
4. This completes network C₁.

NETWORK C₂

TO DESIGN A NETWORK USING THE TABLES

1. L₁ is not used in this network.
2. Transform the impedance of the device to be matched to series form ($R_1 + jX_{Cout}$).
3. Define Q, in column one, as X_{C1}/R_1 .
4. For a desired Q, find the R_S to be matched in the R₁ column and read the reactive value of the components
5. $X_{L2'}$ is equal to the quantity X_{L2} obtained from the tables plus $|X_{Cout}|$.
6. This completes network C₂.

NETWORK D

The following is a computer solution for an RF "Tee" matching network.

Tuning is accomplished by using a variable capacitor for C_1 .

Variable matching may also be accomplished by increasing X_{L2} and adding an equal amount of X_C in series in the form of a variable capacitor.

TO DESIGN A NETWORK USING THE TABLES

1. Define Q, in column one, as X_{L1}/R_1 .
2. For an R_1 to be matched and a desired Q, read the reactances of the network components from the charts.
3. X_{L1}' is equal to the quantity X_{L1} obtained from the tables plus $|X_{Cout}|$.
4. This completes the network.

| Q | X_{L1} | X_{L2} | X_{C1} | R_1 |
